

Describe the job. Anneal builds the agent.

Teams ship agents on vibes. You tweak a prompt, it looks better on the four cases you checked, and nothing tells you whether it actually improved. Anneal gives that process a scoreboard, and refuses changes that do not earn their place.

You give it

A job in one sentence, the tools it may use, and a handful of examples.
Five questions in a browser.

It gives you back

An agent, the evidence it works, and a written record of every change it refused.

The loop

The same six steps whatever the job is, and you watch each one happen.

Design

Wires your goal and tools into several different agents. One alone, a planner and a doer, a doer with a reviewer.

Find the faults

Groups the failures by what actually went wrong, and names the repair each one calls for.

Prove it helped

Re-runs both versions on tasks held back from every earlier step. If the change does not win there, it is gone.

Try it

Runs every design over your examples and scores each one, task by task.

Fix one

Applies that repair. It never spends the same repair on the same fault twice.

Make it cheaper

Walks the winner down to cheaper models for as long as the score holds.

What it moved, and what it refused

Every figure is read out of the committed runs by the reporting tool, never typed in by hand. A test fails the build if the two ever disagree.

AGENT		BEFORE	AFTER
Bug fixing	cost per task	\$0.0899	\$0.026
Bug fixing	slowest run	37.9s	13.5s
Invoice triage	cost per task	\$0.035	\$0.0111
Helpdesk routing	how often it is right	0.000	1.000

On one round the challenger scored **0.800** against the incumbent's **0.767**, and Anneal threw it away, because it made **three** serious mistakes where the old one made **one**. A system that only reports its wins is not measuring anything.

Four agents through the identical loop with no code written for any of them, plus two more built from scratch through the five questions to check it works on a job it had never seen. Accuracy moved both ways; every case where it fell is listed in the repo.
